

Technology & AI Blueprint

One operating system for the public website, clients, contractors, staff, field teams and CEOs.

NORTH STAR

From FM administration to autonomous FM operations.

EntireFM should not bolt AI onto an old CAFM. It should be designed around an event-driven estate graph, policy-controlled AI agents and role-specific experiences from day one.

CLEAN-SHEET BASELINE

The former Base44 system is not used as the requirements baseline. Future screenshots can contribute ideas only.

Working blueprint v1.0 | 22 August 2026

The strategic conclusion

The market has already proved the individual components: AI work-order intake, asset mapping, provider ranking, autonomous follow-up, compliance workflows, mobile evidence, invoice automation and predictive maintenance. EntireFM's advantage is to join them into one managed-service operating loop and expose part of that capability publicly as a high-value acquisition engine.

1 core

OPERATING MODEL

Shared data + policies + workflows

7+

ROLE EXPERIENCES

Public, client, tenant, supplier, field, staff, CEO

12+

AI AGENTS

Specialised agents with controlled permissions

2

PRIMARY LOOPS

PPM Autopilot + Autonomous Helpdesk

WHAT WE SHOULD BUILD

- A single EntireFM identity and data model, not separate disconnected portals.
- PPM Autopilot that turns estate data into scheduled, dispatched, evidenced and billed maintenance.
- An omnichannel helpdesk that converts calls, chat, email and photos into structured jobs and manages them to closure.
- A verified contractor network with dynamic selection, compliance gates and live performance scoring.
- A versioned compliance intelligence engine, not static "frequency tables".
- A CEO command centre that sees operations, financials, risk, clients, supply chain and AI actions in one place.

WHAT MAKES THIS COMMERCIALY DIFFERENT

- The public resource hub becomes a product-led funnel: useful tools save into a free "My Estate" account.
- The client can start mobilising before a salesperson or surveyor touches the account.
- Human FM expertise is applied to exceptions, judgement, safety and relationships - AI does the chasing and admin.
- Every operational action creates better proprietary data: contractor quality, asset failure patterns, job cost and client risk.
- The platform can later support a standalone SaaS / managed technology proposition without changing the core architecture.

Clean-sheet design principles

01 One estate graph

One canonical record for organisations, sites, spaces, assets, obligations, jobs, evidence, spend and suppliers.

02 Events, not forms

Every call, email, sensor alert, photo, expiry, job update and invoice becomes a structured event that can trigger workflows.

03 AI with permission

Agents have explicit tools, spend limits, trade scopes, escalation rules and approval thresholds. No uncontrolled autonomy.

04 Human by exception

Routine work flows automatically; unsafe, ambiguous, expensive or unusual cases route to a competent human.

05 Evidence is mandatory

Completion is not "engineer says done". Required evidence, certificates, photos and signatures gate closure and payment.

06 Client-visible truth

The same operational truth powers the client portal, staff dashboards and CEO reporting - with role-based visibility.

07 Integrate commodities

Do not rebuild telephony, payments, accounting, maps or statutory content when strong systems/APIs already exist.

08 Data compounds

Design every workflow so the platform learns from real outcomes: cost, response, first-time fix, asset condition and contractor behaviour.

What the strongest platforms prove

PLATFORM	WHAT IS ALREADY LIVE / MARKETED	IMPLICATION FOR ENTIREFM
ServiceChannel	AI work-order creation; anomaly detection; provider search/ranking; Action Hub automation; provider compliance; invoice AI roadmap.	Benchmark the end-to-end work-order and provider loop, but make it feel like a managed FM service rather than enterprise software.
Facilio Atom	Voice/chat/email AI helpdesk; triage, dispatch and tracking; agentic service, compliance and finance workflows.	Confirms the autonomous helpdesk is now a real category. EntireFM should connect it directly to its contractor network and client reporting.
SFG20 Mobiliser	AI maps Excel/COBie/FM-system asset data to SFG20 schedules with human confirmation and API output.	Use licensed content/integration where required; differentiate through onboarding UX, estate context and downstream execution.
UpKeep Nova	Scheduled background AI; email-to-work; hands-free field actions; data clean-up; smart routing by skill/location/priority.	AI should work without prompts. Build recurring agent jobs and a field experience designed around voice and evidence.
MRI Evolution	PPM, compliance, SLA controls, contractor certification, BIM/3D, audit trails and mobile workforce.	Enterprise-grade controls still matter. AI cannot replace permissions, auditability, locked obligations and data segregation.
Mitie	Agentic AI direction; AI-enabled service requests; Mozaic360 conversational analytics; IoT/predictive building operations.	A major FM operator is turning AI into its operating model, not just a software feature. EntireFM must move now.
Avero FM	Client/tenant/contractor portals; approved network; reactive dispatch; recurring PPM; quote approval.	Closest UK service-model benchmark. Win through deeper automation, compliance intelligence, data and premium UX.
IBM Maximo / Planon	AI-native asset intelligence, condition/predictive maintenance, digital twins, field execution and prescriptive decision support.	Longer-term direction: connect BMS/IoT and asset health to maintenance decisions rather than relying only on fixed PPM intervals.

Primary sources: ServiceChannel, Facilio, SFG20, UpKeep, MRI, Mitie, Avero, IBM Maximo, Planon (accessed Aug 2026).

The whitespace is orchestration

One platform, many doors

The estate graph is the product foundation

PHYSICAL ESTATE

**WHY THIS MATTERS**

Every agent works on the same graph. “Which electrician should attend?” can consider site, asset, warranty, contract, skill, location, cost, SLA and previous outcomes in one decision.

The EntireFM agent mesh

AGENT	INPUTS	ACTIONS	AUTONOMY
INTAKE	Voice, email, chat, image	Create/merge request; classify; ask missing questions	Low-risk auto
MOBILISER	Files, photos, BIM, asset labels	Normalise estate/asset data; propose mappings	Confirm ambiguous
PPM PLANNER	Assets, obligations, contracts	Build schedule; optimise grouping; create visits	Approve mobilisation
DISPATCH	Trade, skill, geo, SLA, availability	Rank provider; issue job; reassign on failure	Policy thresholds
JEOPARDY	ETAs, SLA timers, job events	Chase, escalate, reallocate, update client	Auto within SLA policy
SUPPLIER	Credentials, performance, coverage	Verify expiries; score; identify network gaps	Suspend requires review
COMPLIANCE	Rules, evidence, changes	Detect gaps; request proof; flag legal uncertainty	Competent-person gate
QUALITY	Photos, forms, certificates, job notes	Check evidence; detect incomplete/contradictory closeout	Reject or request proof
COMMERCIAL	SOR, NTE, quotes, invoice, history	Check price; reconcile; detect duplicates/anomalies	Approval above limit
CLIENT COMMS	Job events + client preference	Proactive updates; summaries; monthly narrative	Auto unless sensitive
ASSET HEALTH	Telemetry, history, condition	Detect degradation; recommend maintenance/replacement	Recommendation first
CEO INTELLIGENCE	All permitted operational data	Explain margin, risk, churn, bottlenecks; run scenarios	Read-first / action gated

RULE: AI NEVER
self-expands permissions

PPM Autopilot: mobilisation to payment

Outcome: The client builds the estate once; EntireFM keeps it maintained, evidenced and commercially controlled.

Initial mobilisation still permits surveys and competent-person validation where the data, risk or contract requires it - automation removes needless legwork, not professional judgement.

Autonomous Helpdesk: request to resolution

AUTONOMOUS BEHAVIOUR EXAMPLES

- No acceptance within 5 minutes -> chase; then offer to next ranked provider.
- Predicted SLA breach -> re-route or escalate before the breach occurs, not after.
- Duplicate call/email -> merge into the existing incident and update the requester.
- Unsafe or ambiguous issue -> immediate human escalation with a structured brief, not a raw transcript.
- Invoice or completion evidence does not match the job -> hold financial closure automatically.

The contractor network becomes a data asset

CONTRACTOR PROFILE

Identity company, VAT, contacts

Coverage postcodes / radius / travel

Capability trades, skills, specialist systems

Compliance insurance, accreditations, licences

Commercial rates, callout, SOR, minimums

Capacity hours, emergency, availability

Performance response, fix, recalls, evidence, cost

Risk expiries, complaints, financial flags

DYNAMIC DISPATCH SCORE

NETWORK INTELLIGENCE

- Coverage heatmap: where EntireFM is weak by trade, postcode, response band and client requirement.
- Auto-vetting queue: certificates extracted, expiry dates tracked, anomalies routed for review.
- Pilot mode for new suppliers before full ranking.
- Rate benchmarking by trade, geography, client, time of day and job type.
- Contractor app/portal becomes the operational interface - not another email inbox.

Compliance Intelligence: rules, context, evidence

1. SOURCE LAYER

GOV.UK / HSE / legislation | standards | licensed maintenance content | competent-person policies

2. RULE LAYER

jurisdiction | property type | occupancy | asset | environment | risk | client contract | exemptions

3. EVIDENCE LAYER

task | inspection | certificate | reading | photograph | sign-off | expiry | remediation | audit history

EVERY CHECKER ANSWER SHOULD DISTINGUISH

LEGAL REQUIREMENT

what law actually requires

GUIDANCE / STANDARD

recognised technical basis

TYPICAL PRACTICE

common frequency or control

RISK-BASED

where frequency depends on context

EVIDENCE

what proves completion

CONFIDENCE

source/version + exceptions

The public website becomes an FM operating resource

PRODUCT-LED FUNNEL

- 1 SEARCH**
User lands on a useful answer/tool
- 2 USE**
Gets a real result without a sales gate
- 3 SAVE**
Creates free My Estate account
- 4 BUILD**
Adds sites/assets/documents
- 5 ACT**
Receives actions and reminders
- 6 MANAGE**
Converts to EntireFM managed service

UNBILLED WIP

8

HIGH RISKS

CLIENT HEALTH

- margin erosion
- service sentiment
- open escalations
- renewal / churn risk

SUPPLY CHAIN

- coverage gaps
- rate inflation
- SLA outliers
- credential risk

OPERATIONS

- backlog
- capacity
- repeat calls
- first-time fix

COMPLIANCE

- overdue critical
- missing evidence
- source changes
- portfolio risk

FINANCE

- WIP
- invoice holds
- credit exposure
- quote leakage

AI GOVERNANCE

- automation %
- human overrides
- agent failures
- cost per action

Commercial control should be native, not bolted on

Invoice AI

Extract labour/parts/tax; compare to job, SOR, NTE, quote and PO.

Duplicate detection

Spot same invoice/job/reference/amount patterns before posting.

Margin jeopardy

Flag jobs becoming loss-making before completion, not at month-end.

Rate intelligence

Benchmark contractor rates by trade, geography, client and time band.

Accrual / WIP

Estimate unbilled cost and revenue from live job state.

Client budget

Live committed, forecast and actual spend with explainable variances.

Approval policy

Autonomous under defined limits; route exceptions with complete context.

Accounting sync

Push approved commercial data to Xero/Sage/ERP; keep operational truth in core.

Field app: designed for proof and speed

The image displays three mobile app screens representing different stages of a field workflow:

- BEFORE: Job pack**
 - asset history | hazards | access | manual | parts | previous faults
 - Asset
 - Task
 - Evidence
 - COMPLETE
- ON SITE: Hands-free**
 - check in | voice notes | diagnose | request approval | capture readings
 - Asset
 - Task
 - Evidence
 - COMPLETE
- CLOSE: Evidence gate**
 - required photos | test results | certificate | parts | signature | defect follow-up
 - Asset
 - Task
 - Evidence
 - COMPLETE

Offline-capable | QR / NFC | geofenced attendance where appropriate | voice-first | camera-first | no job closure without required evidence

Trust architecture: autonomy without losing control

Build the differentiator; integrate the commodity

OWN THIS

DIFFERENTIATION / VALUE ->

P0 FOUNDATION + CORE LOOPS

P2 LATER

Measure whether the platform is actually working

Automation rate	% eligible workflow steps completed without human touch	>60% routine admin	Time to dispatch	request received -> accepted provider	<5 min target classes
SLA save rate	jeopardised jobs recovered before breach	trend upward	First-time fix	jobs resolved without repeat attendance	portfolio + provider
PPM evidence complete	planned tasks closed with required proof	~100% statutory	Mobilisation effort	manual hours / 100 assets onboarded	drive sharply down
Invoice exception rate	invoices held for mismatch / duplicate / policy	measure + reduce	Gross margin leakage	variance expected vs actual job margin	detect before close
Client self-service	requests / reports / approvals completed digitally	increase	Supplier performance	score, response, acceptance, recall, evidence	data-led ranking
Compliance risk	critical actions overdue / missing evidence	zero tolerance classes	AI override rate	human reversals of agent recommendations/actions	quality + governance
Cost per work order	internal admin + communication overhead	decrease	Free-to-managed conversion	My Estate users becoming paying FM clients	growth KPI
Data quality	assets/jobs/suppliers meeting minimum completeness	>95% key fields	CEO visibility	manual reporting packs required	aim for near-zero

The decision for the rebuild

RECOMMENDED PRODUCT POSITION

Build the FM company that practically runs itself.

The website should be the public front door to the same operational platform that clients, contractors, staff and leadership use. The platform should automate routine coordination from asset mobilisation through maintenance, reactive response, evidence, compliance and commercial control - while keeping competent people in charge of risk, judgement and relationships.

01

Lock foundation architecture

Define the canonical data model, identity/permissions, events, policies and AI action audit before designing detailed screens.

02

Design the two core loops

PPM Autopilot and Autonomous Helpdesk should become executable state machines, including every exception and human gate.

03

Then use Base44 screenshots

When supplied, review them only for useful UX/features. Nothing old is presumed correct or carried forward automatically.

This document is the working north star. Feature-level specifications should now be derived from it, not from the legacy CAFM build.
